

## Paper 2

1. What does this paper warn us about/what was the purpose of this study?
2. How did researchers demonstrate the validity of their concerns?
3. What is the purpose of the *I*-statistic
4. Was there a significant difference in the ranges of sasquatch and black bears?
5. Even if you are not plotting species distributions on a map, how might the warnings in the paper apply to your data collection from databases next week or in the future?
